## ALABAMA ADULT TOBACCO SURVEY

## Introduction

The Capstone Poll at The University of Alabama conducted a survey of Alabama residents for the Alabama Department of Public Health to gauge current tobacco-related behavior and attitudes regarding smoking, exposure to secondhand smoke, and policies affecting tobacco use. The survey was conducted in the fall and winter of 2013-2014, and followed the CDC specifications for the Adult Tobacco Survey. There were 1124 respondents who completed the questions which are available by request in a separate document. The study followed the methodology prescribed by the CDC for conducting the 2013 ATS and can also be found in a separate document.

The study population for the survey included a random sample of adult residents of Alabama 18 years and older. The interviews were conducted by telephone at the Capstone Poll at The University of Alabama between October 1, 2013 and February 26, 2014. Percentages based on the full sample (1124 interviews) have a margin of error of $\pm 3$ percentage points with a $95 \%$ confidence level. It is important to note that percentages based on subgroups of the sample will have a larger margin of error. For example, a subsample of 400 respondents would have a margin of error of $\pm 5$ percentage points.

The respondents were contacted by calling a sample of random residential phone numbers (landlines) and a sample of random cell phone numbers throughout the state of Alabama. For each successful household contact, a respondent was randomly selected from among all the adults in the household using an automated algorithm. If the selected respondent was available, an interview was attempted; if the selected respondent was not available, a call back was arranged. For cell phones, the individual answering the phone was considered the target respondent. The target sample for the survey was 750 landline surveys and 250 cell phone surveys, for a total of 1000 completions. The final sample consisted of 863 completions via landline and 261 completions via cell phone.

The interviews were conducted by experienced telephone interviewers employed by the Capstone Poll. The interviewers received additional training specific to the questionnaire used in this project. An experienced supervisor was present during the interview process. Calls were made Monday - Sunday, following the CDC ATS guidelines for timing and number of callback attempts.

The results of the study are presented in this report by topic on pages 2-11 and do not necessarily reflect the order of questions in the survey. Response frequencies are reported on pages 12-51. Crosstabulations of each question by smoking status (smoker, nonsmoker), race (white, black, other), and sex of the respondent are displayed in tables beginning on page 52 .

For this study, current smokers are defined as respondents who indicated that they have smoked at least 100 cigarettes in their life and who currently smoke every day or some days. Former smokers are respondents who indicated they have smoked at least 100 cigarettes in their life and currently do not smoke. Nonsmokers are those who have not smoked at least 100 cigarettes.

For all crosstabulation tables, the significance level of the Pearson's Chi-square statistic is reported in the upper left-hand cell of the table. Significance levels can be characterized as not significant ( $p>.10$ ), marginally significant (. $05<p<.10$ ), or significant ( $p<.05$ ). A statistically significant Chi-square test indicates that there is a reliable difference in the distribution of responses between the groups being compared. The marginally significant differences may show trends that are of interest; however, they are not considered to be as reliable as the significant differences that are reported and should be interpreted more cautiously.

When responses were given in terms of quantities (e.g., number of cigarettes, length of time) and could be considered to be interval or ratio level scales, means were calculated and these appear in the upper-left hand corner of the frequency tables. Whenever appropriate, group differences in means based on smoking status, sex, and race were tested with one-way analysis of variance, and if there were significant group differences, these means appear in the upper left-hand corner of the crosstabulation tables along with a pvalue for the statistical test. A table reporting all of these means together appears at the end of the crosstabulations on page 169-170.

For reporting the crosstabulations by race, three groups are included: White, Black or African American, and Other. However, all of the statistical tests for revealing differences based on race were conducted using only the White and Black or African American groups. This was done because the "other" race category is rather small (unweighted $n=32$ ), and the group comparisons conducted through crosstabulations yield cells for this category with very small numbers, especially when the questions are only asked of current smokers or other subsets of the sample. These numbers are too small to be used appropriately in the statistical tests.

The results presented in this report are based on data that have been weighted, per CDC guidelines, to adjust to census-based proportions of adults for sex and age within the state of Alabama. Data were also weighted to adjust for the number of telephone lines and the number of adults within the household and there was a weighting factor based on type of telephone line (cellphones vs. landlines). Weights were constructed so that the frequencies reported reflect the full adult population of the state of Alabama. It should be noted, however, that statistical tests were conducted using normalized weights, such that they are based on the true sample size of 1124 , rather than a sample size of over 3 million as reflected in the tables. This yields a more conservative test of differences among the groups.

## Results

## Cigarette Smoking Prevalence and History (Q1-Q9, Smoking Status)

Prevalence. Approximately two out of five respondents (41.1\%) reported they had smoked at least 100 cigarettes in their lifetime. Among these, $38.4 \%$ reported currently smoking every day, $5.3 \%$ reported currently smoking some days, and $56.2 \%$ reported currently not smoking at all. Black and female respondents were significantly less likely to have smoked 100 cigarettes than white and male respondents. Less than one in five respondents ( $18.0 \%$ ) are considered current cigarette smokers, with $23.1 \%$ former smokers, and $58.7 \%$ who were never smokers. Smoking status by race and gender are presented in the following table.

|  | Race |  |  | Gender |  |  | Total |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | White | Black | Other | Male | Female |  |  |
| Current smoker | $18.6 \%$ | $12.8 \%$ | $30.1 \%$ | $23.4 \%$ | $13.0 \%$ | $18.0 \%$ |  |
| Former smoker | $23.9 \%$ | $17.6 \%$ | $33.6 \%$ | $24.8 \%$ | $21.5 \%$ | $23.1 \%$ |  |
| Never smoker | $57.3 \%$ | $69.6 \%$ | $36.3 \%$ | $51.7 \%$ | $65.2 \%$ | $58.7 \%$ |  |

Nearly a third ( $30.3 \%$ ) of all respondents indicated they had never tried smoking cigarettes, even one or two puffs. Female respondents (32.6\%) were somewhat more likely to have never tried cigarette smoking than were male respondents (27.6\%).

Quantity. Among respondents who currently smoke every day, $61.4 \%$ indicated that they smoke a half pack or less a day, $26.4 \%$ indicated smoking between a half pack and a pack a day, and $11.9 \%$ said they smoke more than a pack a day. The average number of cigarettes smoked per day by this group is 12.29 . There were significant differences in the quantity of cigarettes smoked by racial group and by gender. White respondents were more likely than other groups to say that they smoke more than 20 cigarettes (a pack) a day, but they were also more likely to say they smoke just one cigarette a day. Black respondents were more likely to say they smoke about 10 cigarettes or half a pack a day. Males were more likely than females to say they smoke one cigarette per day and also more likely to say they smoke 20 cigarettes, while females were more likely to report smoking 10 cigarettes a day.

Respondents who said they had smoked, but do not smoke now, were asked to identify the last time they had smoked a cigarette, even one or two puffs. Nearly $60 \%$ of these individuals said it had been more than 15 years since they had smoked a cigarette. This answer was more frequent among females and black respondents than among males and white respondents. An additional $17 \%$ said it had been 5-15 years since they last smoked, and $16 \%$ had not smoked for between one and five years. The remaining $7 \%$ of this group had smoked sometime within the past year (males: $10.5 \%$; female: $3.9 \%$ ). Three percent had smoked within the past 30 days, but said they do not smoke now, so this group can be thought of as recently quitting.

Participants who do not smoke now but have smoked within the last year were asked if they have decided to stop smoking cigarettes. Nearly three-quarters ( $72.8 \%$ ) said they had made this decision to quit smoking cigarettes. This group of current quitters represents $2.7 \%$ of the total sample.

Individuals who currently smoke cigarettes on some days (but not every day) and those who said they do not smoke but have smoked within the past 30 days were asked on how many days in the past 30 they have smoked. These responses ranged from 1-30 days, with a mean of 11 days. This group reported smoking an average of about four cigarettes per day on the days they smoked.

History. Current and former smokers were asked how old they were when they began to smoke at least one cigarette a day for 30 days in a row. Responses ranged from 9 to 47 years old, with the mean, median and mode of the distribution all being 18 years old. The age of smoking with this regularity was
significantly younger for current smokers (17.58), males (17.68), and white respondents (17.72 years) compared to former smokers (18.40), females (18.49), and black respondents (20.27). Nearly one in five males ( $19.2 \%$ ) said they became established smokers at the age of 14 , compared to $3 \%$ of females; and $14.1 \%$ of whites said they were established smokers at age 14 , compared to $0 \%$ of black respondents.

## Tobacco Purchases (Q10-18)

Among current smokers, $35.3 \%$ said they usually smoked menthol cigarettes in the past 30 days, while less than one percent indicated they had smoked flavored cigarettes in the past 30 days. Most smokers ( $82.4 \%$ ) had purchased cigarettes by the pack on their most recent purchase, while $15.5 \%$ had purchased by the carton. The average price paid for the last pack of cigarettes was $\$ 4.57$, with a range of $\$ 2.00$ to $\$ 6.20$ (median $=\$ 4.75$ ); and the average price for the last carton purchased was $\$ 36.95$, with a range from $\$ 22.00$ to $\$ 55.00$ (median $=\$ 41.00$ ).

Additional purchasing questions showed that coupons, rebates or other special promotions for cigarettes were used by $17.3 \%$ of the smokers for their most recent purchase. Very few (.1\%) had purchased cigarettes over the internet in the past 12 months, and few (2.7\%) had bought cigarettes on an Indian reservation in the past 12 months.

There were few significant group differences by sex or race for the tobacco purchases items. Males and black respondents were more likely to use menthol cigarettes, and males tended to pay a bit more for their packs of cigarettes (Means: male - \$4.67; female $-\$ 4.16$ ).

## Use of Other Tobacco Products (Q19-Q30)

A series of questions asked all respondents (regardless of their cigarette smoking status) about the use of other tobacco projects. Nearly one quarter ( $24.3 \%$ ) reported they had tried smokeless tobacco products (chewing tobacco, snuff, or dip) at least once, and among those who had tried these products, $8.9 \%$ had used it in the past 30 days, averaging use on 23 days of the last 30 . A small percentage ( $4.1 \%$ ) had tried snus at least one time, and $21.8 \%$ of these had used snus in the past 30 days, with an average use of 12 out of the last 30 days. Current cigarette smokers and males were significantly more likely than non-smokers and females to have tried these smokeless tobacco products.

Among the cigarette smokers who have ever used chewing tobacco, snuff, dip, or snus, $42.8 \%$ said they had, at some time, used these products instead of smoking a cigarette or other tobacco product because they were in a place where smoking was not allowed. Males were much more likely ( $47.8 \%$ ) to have used substitute products in this way than were females ( $6.7 \%$ ).

Cigars had been tried at least once by $36.7 \%$ of respondents, and $16.1 \%$ of those had smoked cigars in the past 30 days, averaging 4 days out of the past 30 . Among these recent cigar smokers, $9.6 \%$ indicated they had smoked flavored cigars (e.g., candy, fruit, chocolate flavors) in the past 30 days. Regular pipes had (ever) been used for smoking tobacco by $14.3 \%$ of the respondents, but only a handful of these (5.3\%) had smoked a regular pipe in the past 30 days ( $.8 \%$ of the total sample). Finally, $6.8 \%$ of respondents had ever used a water pipe for smoking tobacco, and $15.2 \%$ of these had done so in the past 30 days ( $1.0 \%$ of
the total sample). Cigarette smokers, males, and white respondents were significantly more likely to use all of these products than non-smokers, females, and black respondents.

Combining all of the questions about the use of various tobacco products, it was found that $20.0 \%$ of respondents smoke at least one tobacco product (cigarettes, cigars, or pipe), and $21.6 \%$ use at least one tobacco product (smoke or smokeless).

## Tobacco Use Cessation (Q31-Q42)

Among all respondents, $18.4 \%$ said they were aware of telephone quitline services. Among smokers and users of other tobacco products, little more than a third (37\%) was aware of the availability of quitlines, leaving nearly two-thirds who said they were not aware of quitline services. Non-tobacco users were even less aware, at $13 \%$. Males and white participants were more likely than females and black participants to be aware of quitline services. When people who had used any tobacco products in the past 30 days were divided into cigarette smokers and non-cigarette smokers, the non-smokers were much more aware ( $54.4 \%$ ) of the quitline services than were the smokers ( $32.8 \%$ ).

More than half ( $60 \%$ ) of the individuals who are currently smoking reported they had seen, read, or heard ads within the past 30 days about quitting cigarettes.

Past quit attempts. More than three-quarters (78.7\%) of current smokers and those former smokers who had smoked within the last two years indicated they had tried to stop smoking at least once in their life. They had quit for one day or longer an average of 5.7 times over their whole life. These responses ranged from 1 to more than 76 times, with a median between 2 and 3 , and a mode of 3 . Within the past 12 months, $51 \%$ had quit for at least a day. Most of these ( $73 \%$ ) had attempted to quit once during the past year, with a range of attempts from 1 to 20 (mean $=2.10$, median and mode $=1$ ) in the past year.

Males were more likely than females to report making only one quit attempt in their life, while females were more likely to report three attempts. For the past year, males ( $51.9 \%$ ) were more likely than females ( $16.4 \%$ ) to report one attempt, while females ( $64.9 \%$ ) were more likely than males (38.1\%) to report making no attempts to quit smoking. On the other hand, if they had made any attempts, females reported more tries at quitting in the past year (mean: males - 1.7; females -3.5 ). Results also showed that whites were more likely to report making one quit attempt in their lifetime or in the past year, compared to black respondents who were more likely to report higher numbers of quit attempts. Mean lifetime quits were 4.74 for whites and 10.3 for blacks; mean attempts in the past year were 1.69 for whites and 3.78 for black respondents.

Information about the use of assistance (quitline, classes, counseling, medications) for their recent attempts to quit is missing from this report due to an error in programming the presentation of questions. (Q36-Q39).

Future quit attempts. Two-thirds ( $67.6 \%$ ) of current smokers and those who had quit within the past year said they want to quit smoking cigarettes for good. Among this group who wants to quit, $13.2 \%$ said they would plan to use a quitline, class, or counseling from a healthcare provider to help them quit; and $46.3 \%$
said they would plan to use some form of nicotine replacement or other medication (nicotine patch, gum, lozenges, nasal spray, inhaler, or pills). Females ( $76.7 \%$ ) were significantly more likely to plan to use medications than males ( $22.1 \%$ ), and white respondents( $51.5 \%$ ) were more likely than black respondents $(23.2 \%)$ to plan to use medications to help them quit. There were no differences in desire to quit or planned use of quitlines, counseling, or classes.

## Role of Health Care Professionals (Q43-Q48)

Nearly all respondents ( $90.7 \%$ ) had visited a health professional in the past 12 months. Among tobacco users, three-quarters ( $76.7 \%$ ) said a health professional had advised them to quit smoking or using tobacco. For those who had been advised to quit, $67.7 \%$ had also been asked if they wanted to quit. Finally, among the group who had been asked if they wanted to quit, $23.6 \%$ were provided with information to help them quit and $46 \%$ had received recommendations or prescriptions for tobacco cessation medications.

Smokers were somewhat less likely than non-smokers to have seen a health care professional in the past year ( $85.9 \%$ and $91.8 \%$, respectively). Among individuals who use any tobacco products and were asked by a health professional if they wanted to quit using tobacco, cigarette smokers were much less likely than non-smokers (i.e., users of other tobacco products) to report that the health professional provided them with booklets, videos, website addresses, or other information to help them quit ( $19.9 \%$ and $61.8 \%$, respectively). Males reported more offers of medications from a health professional compared to females.

Among respondents who currently use no tobacco products and had seen a health professional in the past year, $73.3 \%$ said they had been asked if they smoke or use other tobacco products. Males and black participants were more likely to report being asked this question than females and white participants.

## Tobacco Use at Home (Q49-Q51)

The vast majority of respondents ( $91.6 \%$ ) reported that no one else has smoked inside their home in the past seven days. For the remaining $8.4 \%$, someone else smoked in their home an average of 4.4 days in the past week. For most respondents (81.3\%), smoking is never allowed inside their home, and $59.7 \%$ believe smoking should not be allowed inside any home. Nearly a third of participants ( $30.5 \%$ ), however, were not willing to say what other people should do in their homes, simply indicating that the people who live there should decide that issue.

Smokers and males were more likely than non-smokers and females to report that someone else had smoked inside their homes. They were also less likely to say that smoking is never allowed in their own homes and less likely to endorse the idea that smoking should never be allowed in any home. Likewise, white participants were less likely than black participants to say smoking should never be allowed in homes in general.

## Tobacco Use in the Workplace (Q54-Q57)

Over three-quarters (78.9\%) of respondents who are employed indicated that, during the week prior to the survey, they did not breathe secondhand tobacco smoke at all in their workplace, while $8.4 \%$ reported breathing secondhand smoke four days or more at their workplace. Females were more likely to work indoors, such as in an office; and non-smokers and females were more likely than smokers and males to say that they were not exposed at work to secondhand smoke at all during the week prior to the survey. Approximately one in ten smokers and one in ten male employees said they were exposed to secondhand smoke at work every day of the previous week.

A large majority of respondents ( $92.5 \%$ ) reported that at their workplace, smoking is never allowed in indoor areas. When asked whether they thought smoking indoors in the workplace should be allowed always, never, or at some times or in some places, $85.2 \%$ of respondents indicated that it should never be allowed. Non-smokers, females, and white respondents were the most likely to work in a place where smoking is never allowed. Non-smokers and females were also most likely to say that at workplaces, smoking indoors should never be allowed.

## Tobacco Use in Public Places (Q58-Q60)

Two questions asked respondents whether they thought smoking should be allowed in specific locations always, never, or only at some times or in some places. The first question asked respondents about smoking in restaurants, the second asked about smoking in bars, casinos, or clubs. Responses to the individual questions are as follows: restaurants- $74.6 \%$ never allowed, $21.4 \%$ some times $/$ places, $0.7 \%$ always allowed; bars, casinos, clubs- $38.8 \%$ never allowed, $36.4 \%$ some times/places, $13.0 \%$ always allowed.

In response to the question about restaurants, female respondents () were significantly more likely than male respondents () to indicate that they believe smoking should never be allowed in these locations. For bars, casinos, and clubs, smokers (), males (), and whites () were significantly more likely than nonsmokers (), females (), and blacks () to respond that they believe smoking should be allowed.

When asked how likely they would be to ask a stranger not to smoke around them if they couldn't move away from the smoke, a third of respondents (33.3\%) said "very likely," and $26.5 \%$ said "somewhat likely." The remaining participants said they were "not at all likely" to do this. Nonsmokers, females, and black participants indicated they were more likely to ask a stranger not to smoke compared with smokers, males, and white participants.

## Health Effects of Breathing Smoke (Q61)

A majority of respondents ( $64.6 \%$ ) indicated they think breathing smoke from other people's cigarettes is "very harmful" to one's health, and another $30.9 \%$ said that it was "somewhat harmful" to one's health. Nonsmokers ( $68.3 \%$ ), females ( $81.8 \%$ ), and black respondents ( $84.4 \%$ ) were much more likely than smokers ( $47.7 \%$ ), males ( $45.9 \%$ ), and white respondents ( $60.3 \%$ ) to say that breathing smoke from other people's cigarettes is "very harmful."

## Tobacco Taxes (Q72-Q74)

Approximately seven out of ten respondents (71.7\%) said they would favor an increase in the cigarette tax if the money were used to improve the public's health, while $21.1 \%$ said they would not be in favor of such an increase. Nonsmokers ( $77.9 \%$ ) were much more likely than smokers ( $43.7 \%$ ) to favor an increase in the cigarette tax. Females and black respondents were also more likely to be in favor of an increase, compared to males and white respondents. Among the respondents who said they would favor an increase in the cigarette tax, $22.6 \%$ said that they would be in favor of an increase of more than $\$ 2.00$ per pack of cigarettes, and another $20.7 \%$ said they would favor an increase up to $\$ 2.00$. Interestingly, among those who favor an increase, males and white respondents supported larger increases than women and blacks.

When asked if they would be in favor of an increase in the tax on chewing tobacco, snuff, dip, or snus, if the money were used to improve the public's health, $75.8 \%$ of respondents said they would be in favor of an increase. Again, nonsmokers ( $78.0 \%$ ), females ( $82.3 \%$ ), and black respondents ( $83.9 \%$ ) were more likely than smokers ( $66.6 \%$ ), males ( $68.7 \%$ ), and white respondents ( $74.0 \%$ ) to support a tax increase.

## Demographics (Q52-Q53, Q62-68)

Demographic questions were asked in this survey to describe the characteristics of the sample and to allow for comparing the sample characteristics to the actual state of Alabama resident population. The following table presents both the unweighted and the weighted frequencies for the major demographic questions. The questions used to weight the data were sex and age.

|  | Unweighted <br> Percent | Weighted <br> Percent |
| :--- | ---: | ---: |
| Sex |  |  |
| Male | 35.9 | 47.8 |
| Female | 64.1 | 52.2 |
|  |  |  |
| Age (collapsed into categories | 3.8 | 13.1 |
| 18-24 | 9.4 | 16.9 |
| $25-34$ | 10.7 | 16.5 |
| $35-44$ | 19.0 | 18.1 |
| $45-54$ | 23.9 | 16.9 |
| $55-64$ | 20.0 | 13.6 |
| 65-74 | 13.3 | 6.0 |
| 75 and older |  |  |
|  |  |  |
| Race | 76.7 | 80.7 |
| White | 20.6 | 16.1 |
| Black or African American | 2.0 | 2.9 |
| Other | 0.7 | .3 |
| Refused |  |  |

|  | Unweighted <br> Percent | Weighted <br> Percent |
| :--- | ---: | ---: |
| Hispanic |  |  |
| Yes | 1.6 | 1.6 |
|  |  |  |
| Employed |  |  |
| Yes | 43.9 | 54.0 |
| Marital status |  |  |
| Married | 52.6 | 53.2 |
| Live with partner | 3.4 | 7.7 |
| Divorced | 12.2 | 12.2 |
| Widowed | 15.8 | 8.0 |
| Separated | 3.1 | 2.2 |
| Single, never married | 12.3 | 16.5 |
| Other | 0.6 | .2 |
|  |  |  |
| Education |  |  |
| Less than high school | 9.5 | 8.1 |
| High school diploma or GED | 25.0 | 21.8 |
| Some college or Associate degree | 31.5 | 35.5 |
| Bachelor's degree | 17.8 | 21.7 |
| Graduate or professional degree | 13.0 | 10.9 |
| Don’t know/No answer | 3.2 | 1.9 |
| Income |  |  |
| Less than \$20,000 | 14.2 | 10.9 |
| \$20,000-\$30,000 | 9.8 | 10.5 |
| \$30,000-\$40,000 | 9.3 | 12.8 |
| \$40,000-\$50,000 | 12.0 | 11.9 |
| \$50,000-\$70,000 | 13.5 | 11.8 |
| \$70,000-\$100,000 | 12.4 | 14.4 |
| \$100,000-\$150,000 | 8.6 | 10.9 |
| More than \$150,000 | 6.6 |  |
| Don’t know/No answer | 10.2 |  |
| Telephone type | 23.2 |  |
| Landline |  |  |
| Cellphone |  |  |
|  |  |  |

The use of a cell phone sample to enhance the residence sample is a relatively new methodology. To gain an understanding of the role of the cell phone sample in this study, a comparison was made of the sample demographics for the landline and cell phone samples for both the
unweighted data and the weighted data. Tests of significance with the unweighted data indicate the cell phone and landline samples differ significantly from each other on all demographic variables except Hispanic ethnicity and education level. The distributions are presented in the table below. Within each variable, column values sum to 100 percent (e.g., $32.9 \%$ of the landline sample is male and $67.1 \%$ of the landline sample is female; when weighted, $43.1 \%$ of the landline sample is male and $56.9 \%$ is female).

|  | Unweighted percent |  | Weighted percent |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Landline | Cell phone | Landline | Cell Phone |
| Sex |  |  |  |  |
| Male | 32.9 | 46.0 | 43.1 | 54.3 |
| Female | 67.1 | 54.0 | 56.9 | 45.7 |
| Age |  |  |  |  |
| 18-24 | 1.2 | 12.5 | 2.8 | 25.0 |
| 25-34 | 3.5 | 29.3 | 8.8 | 28.4 |
| 35-44 | 8.6 | 17.6 | 10.9 | 24.4 |
| 45-54 | 19.2 | 18.4 | 20.6 | 14.5 |

* indicates a statistically significant difference ( $p<.05$ ) between the groups identified by this variable, based on analysis of variance test. Race comparisons are between white and black only.

[^0]:    *A skip error on a previous item resulted in question HCWASK being inappropriately skipped for 51 of the 65 tobacco users who had not been advised by a health professional to quit using tobacco.

[^1]:    * Normalized weights (sample size) were used for calculating Chi squares, which yielded the p-levels reported in the upper left-hand corner of the tables. For interval or ratio level variables (e.g., number of days), a one-way analysis of variance was conducted to test mean differences between the groups. When that test was statistically significant, the means and p-level are also reported in the upper left-hand corner. A table of means for all interval variables appears at the end of the crosstabulation tables.
